Abstract: The present study integrated music, emotion, and cognition. It explored the effectiveness of emotion evoked by music as mediator which influenced working memory directly. Working memory was assessed by well-established stoop task. The purpose of this study was to explore the effects on working memory of different emotions evoked by music and then gave a new direction and thinking for the study about the effects of music on cognition. The first experiment explored the effectiveness of music in evoking different emotions, and analyzed gender differences. Both male (n=20) and female (n=20) participants were asked to listen to the same music clips aimed to evoke three kinds of emotions (relaxing, exciting, and irritating), and then rated their feelings on arousal and valence dimensions by the self-assessment manikin (SAM). The second experiment explored the effects of different emotions evoked by music on working memory. Male (n=20) and female (n=20) participants were assigned to three groups (relaxing group, exciting group, and irritating group). Each of the participants took test of working memory without music, and then a test of working memory after listening to music. And the working memory was assessed by stoop task. The results of the study indicated that music can evoke emotions of relaxation, excitement, and irritability; gender has no significant effects on the emotions evoked by music and exciting music leads to a significant improvement on working memory but not relaxing and irritating music. All in all, we can conclude that emotion evoked by music plays an important part in cognitive abilities.

摘要: 自从贝姆性别角色量表 (Bem Sex Role Inventory, BSRI) 1974 年在咨询和临床心理学杂志上发表后, BSRI 就被广泛的用来测量个体的性别角色, 但是贝姆性别角色量表是否具有跨文化和跨时间的一致性, 还有待商榷。本研究的主要目的就是探讨贝姆性别角色量表在当今中国的适用性。1021 (505 名男生, 516 名女生) 名来自全国各地在大连读书的大学生对贝姆贝姆性别角色量表进行自我评估, 并回答一些人口学问题。统计结果表明, 男性在男性化分量表的得分显著高于女性在男性化分量表的得分, 女性在女性化分量表的得分显著高于男性在女性化分量表的得分。信度分析表明, 总体克隆巴赫阿尔法系数为 0.827, 男性化分量表克隆巴赫阿尔法系数为 0.842, 女性化分量表克隆巴赫阿尔法系数为 0.735, 男性化分量表的分半信度为 0.787, 女性化分量表的分半信度为 0.654。探索性因素分析表明, 特征值为 0.6 抽取 22 个因子时, 总解释率为 80.9%, 男性和女性在男性化分量表和女性化分量表中可以对等分开 (除去两个项目归属不理想外), 即该量表的男性化女性化条目的因子归属总体上都可以很清晰地分别归为男性化和女性化这两个维度。这说明在保留尽可能多的量表信息的情况下, 贝姆量表的男性化和女性化区分能力还是很显著的。因此虽然验证性因素分析的结果表明拟合度不是很理想, 而且也有一部分人对贝姆性别角色量表跨文化和跨时间的适用性提出了质疑, 或许未来我们确实需要比贝姆性别角色量表更好的测量性别角色的工具, 但根据本研究探索性因素分析的结果来看, 贝姆性别角色量表在中国文化中是能够做出男性化与女性化的区分的, 尽管如果稍微改变几个条目的话效果可能会更好。

The applicability of the Bem Sex Role Inventory in Chinese culture

Yang Qin Zengyou Xin Hong Li

Liaoning normal university ,Dalian,116021

Abstract: BSRI has been widely used to measure an individual's gender roles since it was firstly published in the Journal of Counseling and Clinical Psychology, in 1974. But whether BSRI has cross-cultural and cross-time consistency is still open to question. The main purpose of this study is to investigate the applicability of BSRI in China.1021 college students (505 men, 516 women) across the country who are learning in Dalian are asked to make self-assessment about BSRI, and answer some demographic questions. Statistical results demonstrate that scores of men are significantly higher than women in the masculine subscale while just the opposite in the feminine subscale scores. Reliability analysis indicates that the overall Bach Cologne alpha coefficient is 0.827 with 0.842 for masculine subscale and 0.735 for feminine subscale; the split-half reliabilities are 0.787 for masculine subscale and 0.654 for feminine subscale. Exploratory factor analysis reveals that when the characteristic value is 0.6 and 22 factors are extracted, the overall explain rate is 80.9%, men and women both in masculine and feminine subscales can be separated (except for two items), namely that the factor attribution of both masculine and feminine items can be clearly classified as masculine and feminine. This shows that in the case of the retention of information as much as possible, the masculine and feminine distinguish ability of BSRI is still significant. Therefore, although the results of the confirmatory factor analysis showed that the goodness of fit is not very good, and there are some people questioning the cross-cultural and cross- time applicability of BSRI. Perhaps in the future we do need better tools for measuring gender roles than BSRI. But according to the results of exploratory factor analysis in this study, BERI is able to make the distinction between masculine and feminine in Chinese culture, although the effect might be better with a little change of several items.
